Imaginative Qualities of Actual Things Gilbert Sorrentino 1991

Gilbert Sorrentino's third novel is about the New York artistic and literary world of the 1950s and '60s, specifically the artists, writers, hangers-on, and the phonies who populated that world. In a prose that is ruthless as well as possessed of an enormous comic verve, the dedicated, the stupid, the rapacious, and the foolish are dissected. Eight major characters, many of whom reappear in Sorrentino's later novels, are employed to allow the reader a

variety of views of the same world. Told in the weary voice of a cynical and sardonic narrator, the novel is crammed with fantastic characters, incidents, and episodes, and moves from wit and satire through elegiac brooding, to bitter invective. It is a superb re-creation of a real time and place.

Land and Its Uses — Actual and Potential F. T. Last 1986

During its existence the Ecosciences Panel of the North Atlantic Treaty Organisation was constantly concerned with (i) the communication gap between the generators of ecological/environmental information and those who use it and (ii) the narrow interpretation of 'environmental' which too frequently was taken as being synonymous with pollution. Because of this concern, and because the panel recognised that land-use is perhaps the overriding facet of environmental policy it was decided to arrange the Seminar recorded in this volume :- Land and its Uses : Actual and Potential An Environmental Appraisal The development of this Seminar was chaired by Professor F. T. Last who was enthusiastically supported by B. G. Bell (U.K.), Drs S. Bie (Norway), O. W. Heal (U.K.), R. Herrmann (Federal Republic of Germany), M.C.B.Hotz (formerly of NATO, Belgium, but now in Canada), L. Munn (Canada) and N. Yassoglou (Greece). Together, they decided that the participants should include (i) planners/decision makers and (ii) scientists generating ecological/environmental information, in the hope that they would gain a better understanding of each others problems and attitudes and as a result identify how information can be prepared in a more usable form.

Bearing Life and Failure Distribution as Affected by Actual Component Differential Hardness 1965 Rolling-contact fatigue tests were performed on SAE 52100 207-size deep-groove ball bearing determine the relation between bearing fatigue life and actual bearing component hardness differences and the effect of actual component hardness differences on bearing fatigue life scatter. The 207-size bearings with inner and outer races from the same heat of SAE 52100 material and with nominal Rockwell C hardnesses of 63 were assembled with SAE 52100 balls from the same heat of material tempered to nominal Rockwell C hardnesses of 60, 63, 65, and 66. Test conditions included an inner race speed of 2750 rpm, a radial load of 1320 pounds, which produced maximum Hertz stresses of 352 000 and 336 000 psi at the inner and the outer races, respectively, and a highly purified naphthenic mineral oil as the lubricant. Subsequent to testing, the bearings were disassembled, and all component hardnesses were measured. The bearings were regrouped according to their actual values of AH for Rockwell C hardness increments of 0.5 and 1.0, where AH is the difference between the actual hardness of the rolling elements in the bearing and the actual hardness of the inner race. The fatigue life and scatter results were compared with component hardness combinations and data previously obtained from the five-ball fatigue tester. The following results were obtained
